

## memory wire

Memory wire is a very hard wire that maintains a circular shape. Always use a memory wire cutter instead of a regular wire cutter.

There are two ways to end memory wire:

### **Method #1:**

Dab a bit of glue onto the end of the wire and insert it into a half-drilled bead.

### **Method #2:**

Use round-nose pliers to roll the very end of the wire into a loop.

\*Tip: Memory wire is very stiff - making this loop may be difficult.

Refer to the Simple Loop Technique for more directions on making a loop.

You can also use the Simple Loop technique to add a dangle.
